## Livestream app for macbook

The best MacBook is a tricky thing to decide, and it just got a little more complicated. The move from Intel processors to Apple silicon, starting with the Apple M1 chip will change the MacBook as we know it, as our MacBook Air with M1 review shows. But one size doesn't fit all once you take a closer look at the best MacBooks. There are specific reasons why many should pay more for the M1-based MacBook Pro. Plus, there's still an audience for those who prefer intel-based MacBook Pros, and the 16-inch model only comes with Intel for now. The new MacBook Air 2020 is our top recommendation for the best MacBook overall. New Apple's Apple M1 chip makes it faster than we ever expected the Sky to get, and its power efficiency enables much longer battery life, lasting about 14 hours on a charge. But if you need more than 16GB of RAM, or want 4 Thunderbolt USB-C ports (and not 2), this conversation gets more complicated, and you're going to want to watch the Intel-based MacBooks as well. Image 1 of 4 (Image credit: Henry T. Casey/Tom's Guide)Image 2 of 4 (Image credit: Henry T. Casey/Tom's Guide)Image 3 of 4 (Image credit: Henry T. Casey/Tom's Guide)Image 4 of 4 (Image credit: Henry T. Casey/Tom's Guide)Display: 13.3 inches; 2,560 x 1,600 | CPU: Apple M1 | GPU: Integrated 8-Core GPU | RAM: 8GB-16GB | Storage: 256GB-2TB SSD | Weight: 2.8 poundsSuper-fast performanceIncredibly long battery lifeComfortable keyboardStill has thick bezelsLight on ports The MacBook Air was always the best MacBook for most people, but now it's better for even more people than ever before. Apple's decision to replace its Intel processors with its own Apple Silicon, starting with the M1 chip in the MacBook Air, is reaping serious rewards. This laptop's 14 hours and 41 minutes of battery life in the Tom's Guide battery test is best for a MacBook Air ever. Plus, the M1 delivers crazy-fast performance, so much so that it can run serious games at all. The MacBook Air's webcam has also been upgraded as the M1 chip offers signal processing tricks to improve clarity and color accuracy. And, of course, the Magic Keyboard is still here, which offers a comfortable typing experience. Dolby Atmos audio support means some movies and TV shows will sound even better than before. The MacBook Air is now not only the best MacBook for your average Apple user, but it's closer to the title of king of laptops than it has been in years. Read our full MacBook Air with M1 review. (Image credit: Apple) Display: 13.3 inches, 2560 x 1600-pixel | CPU: Apple M1 8-Core CPU | GPU: Apple M1 8-Core GPU | RAM: 8GB to 16GB | Storage: 256GB to 2TB SSD | Weight: 3.0 poundStellar overall

and game performanceExcellent battery lifeLightning-fast SSDNot enough ports This tick bezelsImage 1 of 4 (Image credit: Future)Image 2 of 4 (Image credit: Future) Image 3 of 4 (Image Futures)Image 4 of 4 (Image Credit: Future)The MacBook Pro with M1 takes everything we like about the M1-based MacBook and then it on a notch or two. For example, it lasted a whopping 16 hours and 32 minutes on the Tom's Guide battery test, beating the M1 Air (14:41) by nearly 2 whole hours. On top of that, the MacBook Pro's 434.8-nit display is brighter than the Air's 365.8-nit panel. And on the Handrem video transcoding test, it converted a 4K movie to 1080p in 7 minutes and 44 seconds, beating the already speedy MacBook Air's 9:15.Other pros includes Dolby Atmos audio, improved webcam video quality (thanks to the M1's new signal-processing chip), the sharp 2560x1600-pixel Retina display and iOS And don't forget the Magic , which is a real joy to tap on. Displays: 16 inches, 3072 x 1920 pixels | CPU: Intel Core i7 or i9 | GPU: AMD Radeon 5300M or 5500M | RAM: 8GB - 32GB | Storage: 512GB - 2TB SSD | Weight: 4.3 poundsMagic Keyboard feels greatBest audio ever in a laptopEpic battery life of nearly 11 hoursDisplay not 4KHeavier as 15-inch MacBook ProImage 1 of 4 (Image credit: Tom's Guide)Image 2 of 24 (Image credit: Tom's Guide)Image 3 of 4 (Image credit: Tom's Guide)Image 4 of 4 (Image credit: Tom's Guide)The biggest MacBook - the 16-inch MacBook Pro - has yet to be converted to Apple's M1 chip yet , and for many a video editor and streamer, there's a good reason to wait. While Apple's Final Cut Pro has been updated for Apple silicon, it's not the only video editing application in the game. Adobe Premiere Pro, arguably the dominant choice in the industry, is still an Intel-based application, which would run through Rosetta 2, the technology apple uses to enable backward compatibility. Therefore, we recommend the Intel-based 16-inch MacBook Pro for the creators who need rock-solid reliable performance, delivering its Intel Core i9 processor in spades. Not only is this the best MacBook for demanding professionals for its speed, but its 16-inch panel is perfect for reviewing your projects, with its 429-nit screen delivering a bright and colorful picture. On top of that, add nearly 11 hours of battery life, and you're good at going to work anywhere you need to be. Read our full MacBook Pro (16-inch) review. Display: 13 inch Retina Display (2560 x 1600) | CPU: 1.4GHz quad core 8th gen to 2.3GHz 10th gen Core i7 | GPU: Intel Iris Plus 645, Intel Iris Plus | RAM: 8GB to 32GB | Storage: 256GB to 4TB SSD | Weight: 3.1 poundgreat performanceFantastic Magic KeyboardLong battery lifeBezels to get thickPricey to 10th gen powerRight now, the remaining Intel-based 13-inch MacBook Pro is the hardest MacBook to recommend – but some people will still choose it. Maybe you're using demanding apps (such as video editor's suites) and you're not sure if it's still time to jump to M1-based hardware, and you want to make sure your applications are running without errors. While those applications are likely to get universal versions at some point, not everyone is here yet. Do you have many peripherals? If want four Thunderbolt 3 ports (and not the two two get with M1 MacBooks) you can just go Intel now. Plus, the 13-inch Intel MacBook Pro is the only version that can be customized with 32GB of memory or 4TB of storage, and that 16GB of RAM limit for the 13-inch M1 MacBook Air could be a cause for complaint for those using higher-end applications. Just don't expect the fastest raw performance. The Intel MacBook Pro's Geekbench 5 score of 4,399 falls off and tries to overern the newer MacBook Pro's 5,882 score. And while the Intel-based MacBook Pro conveyed a 4K video in 12 minutes and 43 seconds, he finished M1-based Pro (7:44) nearly 5 minutes earlier. Read our full MacBook Pro 13-inch (Intel, 2020) review. Our picks for the best gaming laptops How to choose the best MacBook for youPerformance: If you know you're not pushing your laptops to their borders, get the MacBook Air and get the entry-level model. Its 8-core M1 chip and 8GB of RAM are going to surprise you with their speed. Upgrade that RAM to 16GB if you keep many applications open simultaneously. Those who work with more demanding applications will either want to get the M1 MacBook Pro (check with your favorite applications to see if they're updated for Apple silicon) with 16GB of RAM, or consider an Intel-based MacBook with 32GB of RAM. Storage is quick up and down the lineup. Graphics and gaming: For M1-based MacBooks, you get either a 7-core or 8-core integrated GPU, and we've seen amazing results on the 8-core version — so upgrade if you want to spell on your Mac. Yes, you can now play serious video games on the Mac. It's impressive. Size and weight: The 13-inch MacBook Air and Pro are distinguished only by the air's wedge shape and slightly lighter weight. The MacBook Pro (3.0 pounds for M1, 3.1 pounds for Intel) is 0.2 - 0.3 pounds heavier than the 2.8-pound MacBook Air. Unsurprisingly, the 16-inch MacBook Pro — which is a heavier 4.3 pounds — is best for those who either don't mind charging in their pocket or not moving around so often. Battery life: The M1 MacBook Pro is the longest lasting MacBook out there, posting a Tom's Guide battery test time of 16:32. It beats the M1 Air (14:41), Intel-based 13-inch Pro (10:21) and the 16-inch Pro (10:55). How we find the best MacBooksTo best MacBook, we each run through our gauntlet of benchmarks and actual tests, and then use them as our main computer for as well. Only then are we comfortable recommending them (or not) for your purchase. We use a Small K-10A colorimeter to test each MacBook's screen to find its average brightness and color quality (so we don't just assume Apple's ratings are correct). When it comes to general performance, we use the Geekbench 5 (CPU performance) benchmark, and time how long the Macs will take to transcode a 4K video to 1080p. We also run the BlackMagic storage speed test to see how fast these MacBooks' SSDs are (spoiler alert: they're all pretty fast). Then we run our battery test to see how long each MacBook (at 150 nits of can last browse the web over Wi-Fi until it runs out of juice. We tested several computer games on MacBooks, with civilization VI being one of our current favorites to run. Run.
